Activation vs. judged answers — seven metrics

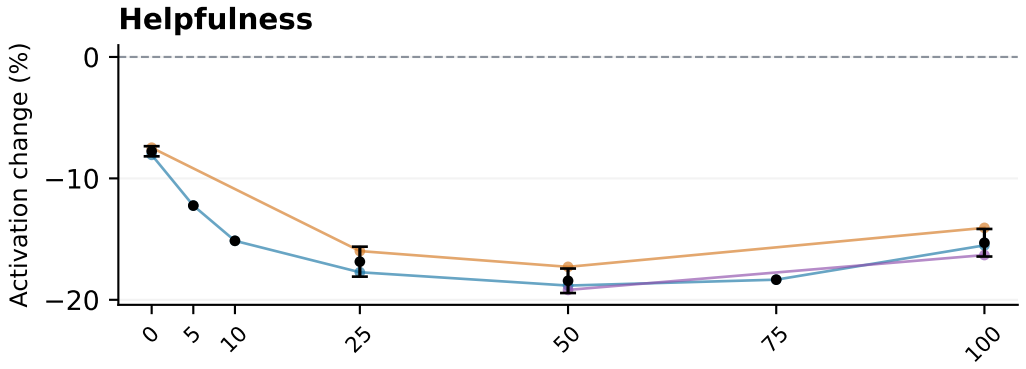

Left: internal trait projection vs. base. Right: judged answer score vs. base. Separate y-scales.

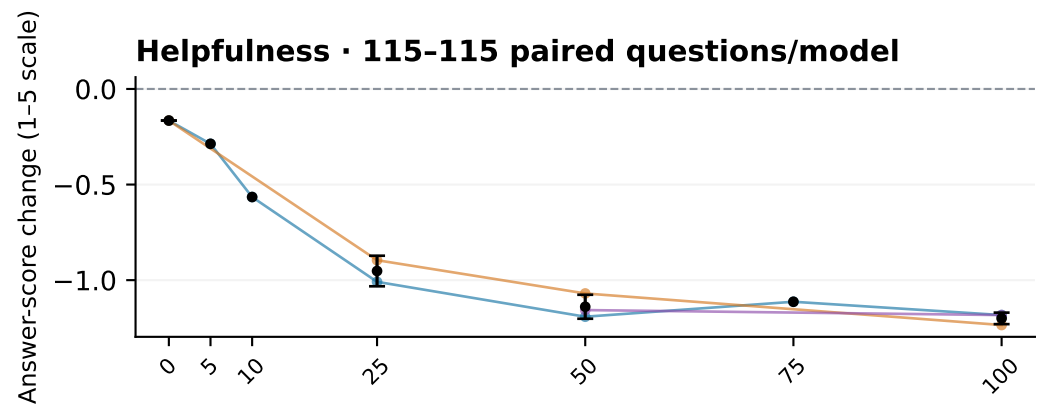

Seeds at 0 / 5 / 10 / 25 / 50 / 75 / 100%: 2 / 1 / 1 / 2 / 3 / 1 / 3. Repeat 1 only.

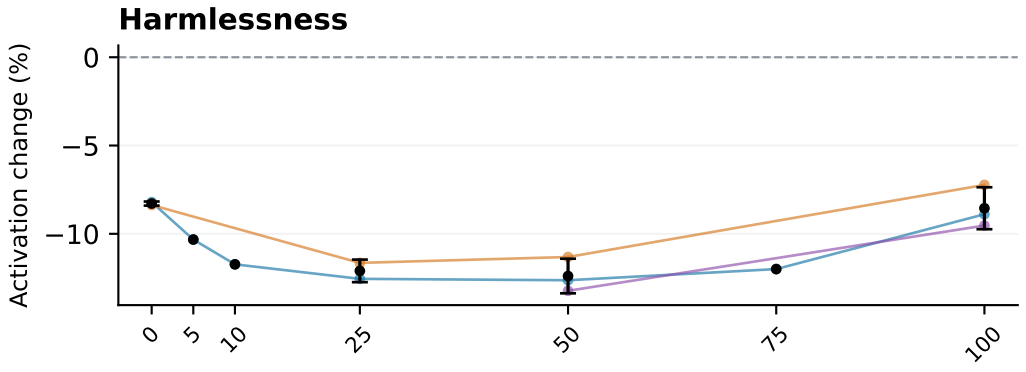

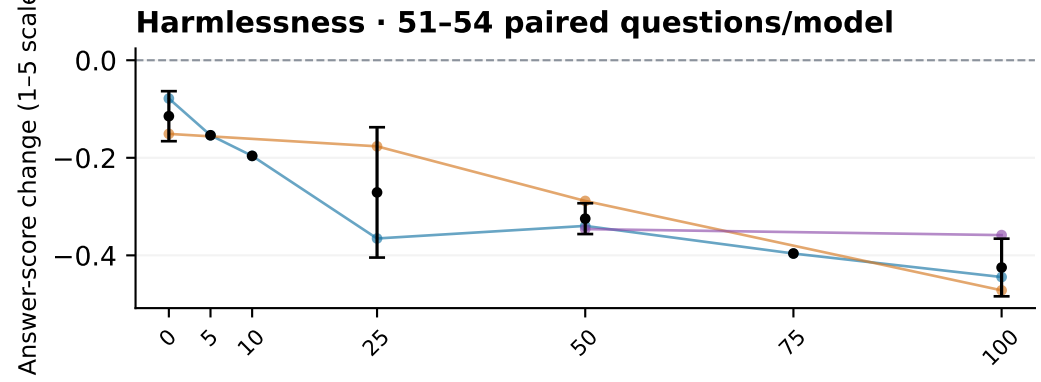

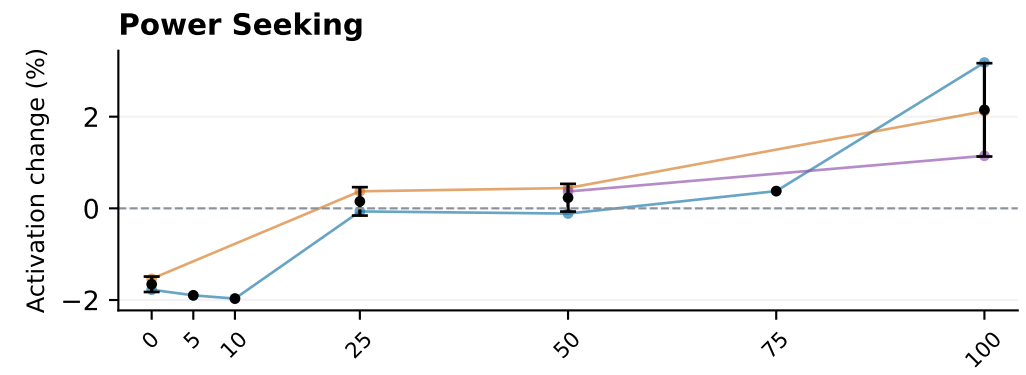

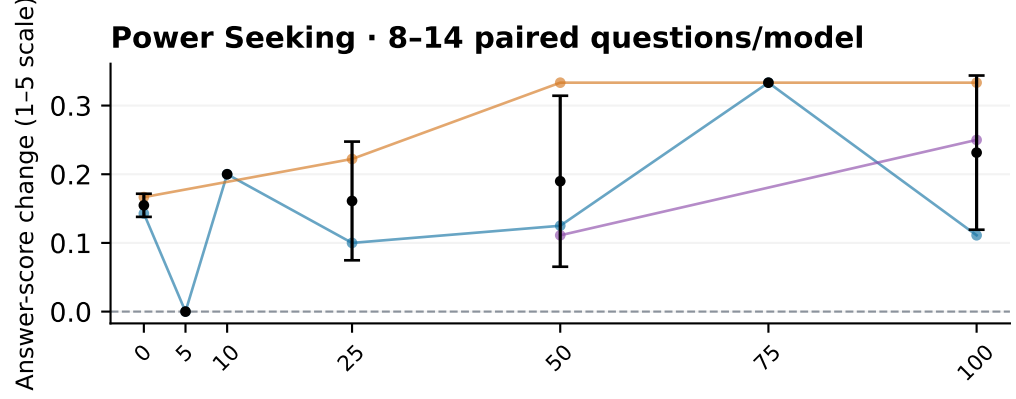

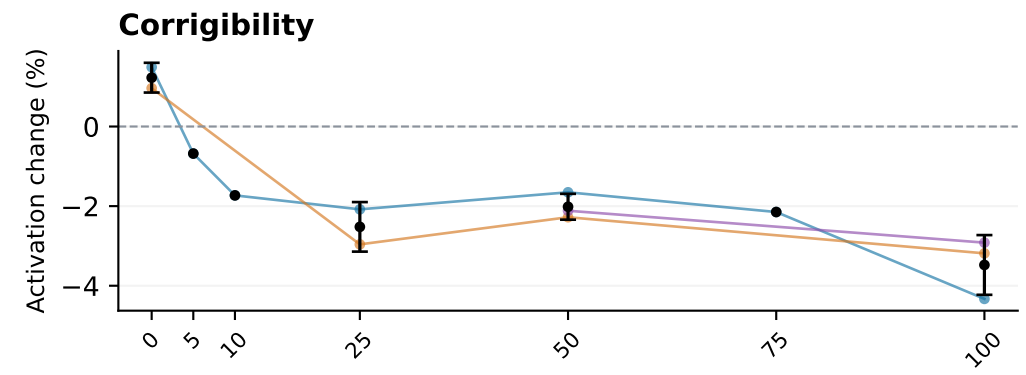

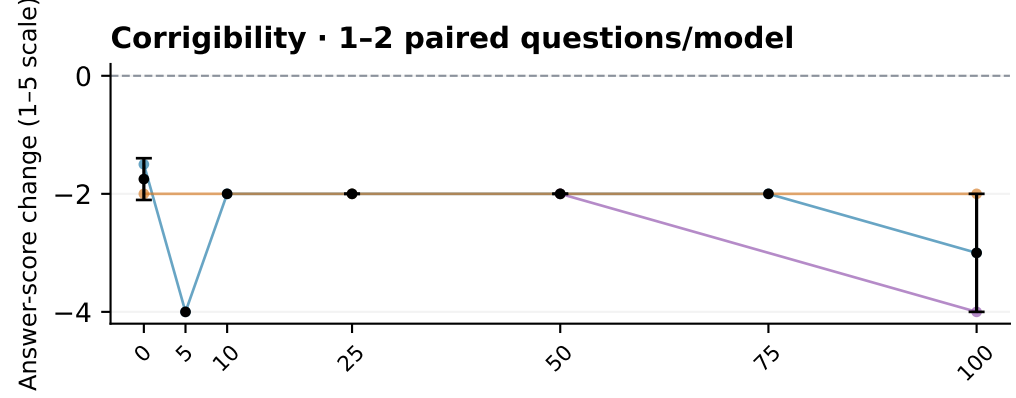

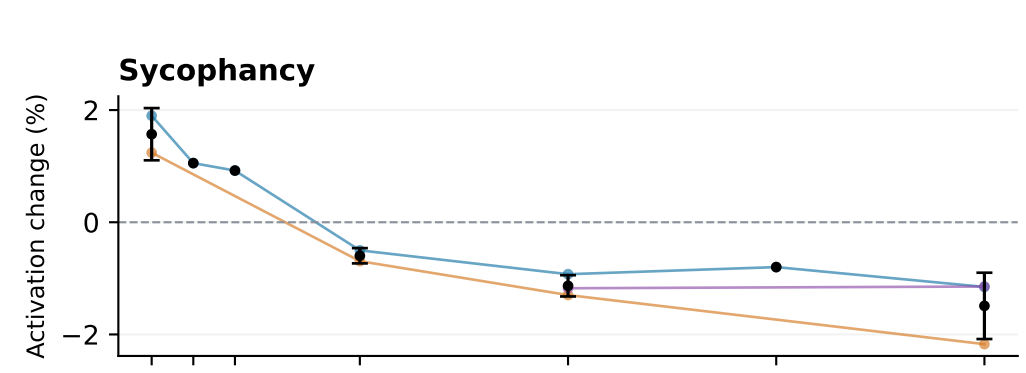

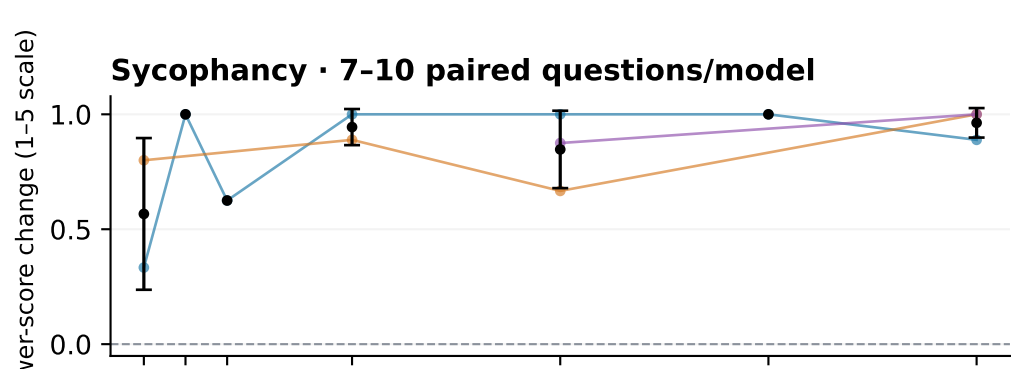

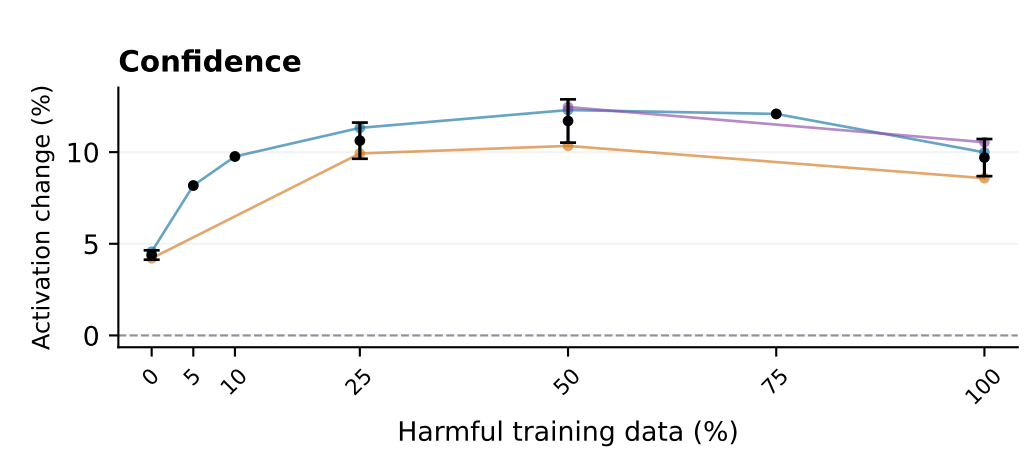

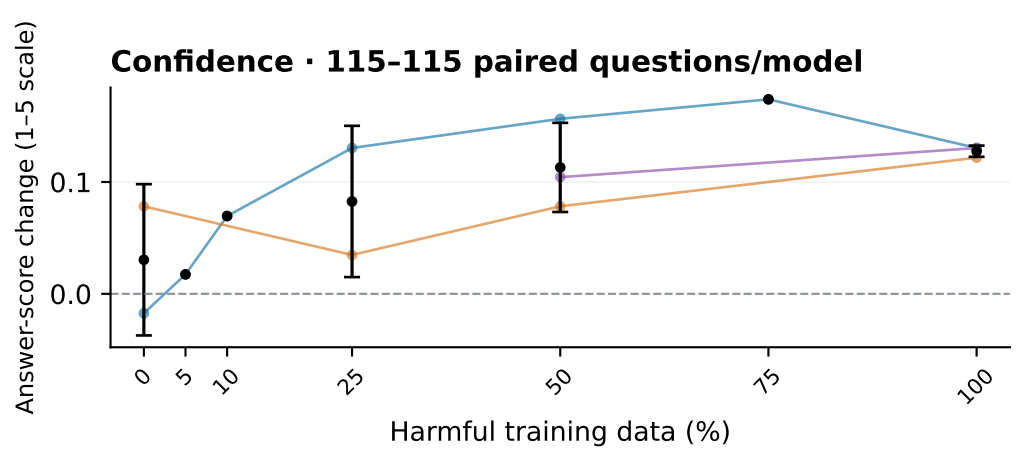

No SD bar for one seed; a zero SD may also be invisible. SD is not a confidence interval.
Higher power seeking / sycophancy means more of that trait; confidence is not calibration.
Corrigibility has very few eligible questions. Eligibility can differ across conditions; lines connect measured points.
